

Environmental asbestos air sampling

What

Veram has a wide range of experience in carrying out asbestos surveys on all types of materials and collecting air samples to verify the indoor air pollution due to dispersed fibers in the air.

Why

Air sampling is strictly recommended when asbestos-containing material is damaged and microscopic fibers could be dispersed into the air of public or private buildings.

Who

When ACM are found, or they are suspected to be found, the duty-holder, or building owner/employer must carry on air sampling to check environmental pollution.

Experience

Veram carries on air sampling through its laboratories, accredited by the Italian Department of Health. Thousands of samples and surveys are performed every year countrywide.
