

Photocopiers and laser printers health hazards

What

We perform surveys to identify hazards deriving from direct exposure to toner and emissions during the photocopying process.

Why

Several substances such as toner, carbon monoxide, ozone, have known risks to health, both on direct exposure and resulting from emissions during the photocopying process. Risk assessment can be performed through environmental surveys.

Who

Risk assessment and surveys to identify hazards deriving from direct exposure to toner and emissions are typically performed in those workplaces containing printers and/or photocopier.

Experience

Veram regularly performs Indoor Air Quality surveys for the research of airborne contaminants, through its calibrated instruments, in accordance with international technical standards.
